881. Proposed by Kim McInturff, Santa Barbara, California.

Prove that for every positive integer n

$$\sum_{k=0}^{n-1} \binom{2k}{k} = \sum_{i=1}^{n} \frac{2 \sin \frac{2i\pi}{3}}{\sqrt{3}} \binom{2n}{n+i}.$$

Solution: *(by José M. Pacheco and Ángel Plaza, University of Las Palmas de Gran Canaria, 35017-Las Palmas G.C., Spain)*

First, notice that the coefficient $\frac{2}{\sqrt{3}} \sin\left(\frac{2i\pi}{3}\right)$ takes the values $+1, -1, 0, +1, -1, 0, \ldots$, and thus the right-hand side (RHS) may be written as $\sum_{i=1}^{n} i_{[3]} \binom{2n}{n+i}$, where $i_{[3]}$ represents, for $i = 1, 2, \ldots$, the successive values of the sequence $+1, -1, 0, +1, -1, 0, \ldots$

The equation may be proved by induction. For the first values of n we have:

- $n = 1$: $\binom{0}{0} = +\binom{2}{2} = 1$

- $n = 2$: $\binom{0}{0} + \binom{2}{1} = +\binom{4}{2+1} - \binom{4}{2+2} = 3$

- $n = 3$: $\binom{0}{0} + \binom{2}{1} + \binom{4}{2} = +\binom{6}{3+1} - \binom{6}{3+2} + 0\binom{6}{3+3} = 9$

Let us suppose the expresion is true for n. Now, for $n + 1$ it is:

$$(LHS) = \sum_{k=0}^{n} \binom{2k}{k} = \binom{2n}{n} + \sum_{k=0}^{n-1} \binom{2k}{k} \tag{1}$$

$$(RHS) = \sum_{i=1}^{n+1} i_{[3]} \binom{2n+2}{n+1+i} \tag{2}$$

By applying twice the Pascal's rule, $\binom{n+1}{k} = \binom{n}{k} + \binom{n}{k-1}$, then for every integer m, $\binom{2n+2}{m} = \binom{2n}{m-2} + 2\binom{2n}{m-1} + \binom{2n}{m}$, and using this into Eq. (2) we have:

1

$$(RHS) = \binom{2n}{n} + 2\overbrace{\binom{2n}{n+1}} + \underbrace{\binom{2n}{n+2}}$$

$$\overbrace{-\binom{2n}{n+1}} \underbrace{-2\binom{2n}{n+2}} - \cancel{\binom{2n}{n+3}} + 0 +$$

$$+ \cancel{\binom{2n}{n+3}} + 2\binom{2n}{n+4} + \binom{2n}{n+5} - \dots$$

$$+ (n+1)_{[3]}\left[\binom{2n}{2n} + \binom{2n}{2n+1} + \binom{2n}{2n+2}\right] =$$

$$= \binom{2n}{n} + \binom{2n}{n+1} - \binom{2n}{n+2} + \binom{2n}{n+4} - \binom{2n}{n+5} +$$

$$\dots + (n)_{[3]}\binom{2n}{2n} + c_{n+1}\binom{2n}{2n+1} + c_{n+2}\binom{2n}{2n+2}$$

It is easy to see that the coefficient of the term $\binom{2n}{2n}$ is always $(n)_{[3]}$. On the other hand, the coefficients of the last two terms, noted by c_{n+1} and c_{n+2}, depend on the value of $(n+1)_{[3]}$, but these two terms are zero because the lower index is greater than the upper one.

Therefore, (RHS) is the sum of $\binom{2n}{n} + \sum_{i=1}^{n} i_{[3]}\binom{2n}{n+i}$, and by the induction hypothesis $(RHS) = \binom{2n}{n} + \sum_{k=0}^{n-1}\binom{2k}{k} = \sum_{k=0}^{n}\binom{2k}{k} = (LHS)$ and the proof is done. $\square$
